BOTSWANA COMMUNICATIONS REGULATORY AUTHORITY (BOCRA)

TECHNICAL PROPOSAL: BOCRA UNIFIED DIGITAL PLATFORM

Transforming Regulatory Services Through a Modern, Integrated Digital Platform

Hackathon: BOCRA Website Development Hackathon
23 – 31 March 2026
Submission Date: 27 March 2026

Team Members: BUG FINDERS

- **Oageng Motlapele** – Developer, Machine Learning, UI/UX Designer, DevOps, Hacker
- **Carol Kutjwe** – UI/UX Designer
- **Dimpho Ramotlhagodi** – Developer
- **Lawrence Ramotlhagodi** – Developer
- **Bianca Bogorogile** – Developer, Machine Learning, Business Analyst

1. Executive Summary

- The current BOCRA website operates as a **static information portal** disconnected from licensing, complaints, and analytics systems.
- Users navigate **fragmented pages**, encounter broken links, and face **manual processes** that delay service delivery.
- Stakeholders—including internal staff, industry players, and the public—require **distinct engagement experiences**, yet the platform offers a one-size-fits-all approach.
- The **proposed BOCRA Unified Digital Platform** is a modern, integrated solution built on **Python, JavaScript, MySQL, HTML5, and CSS3**.
- Frameworks include **Flask API, Bootstrap, Chart.js, DataTables.js, and Font Awesome**.
- The platform automates **licensing validation, complaint routing, and document processing**.
- A local **large language model (Ollama)** powers **policy simplification and semantic search**, keeping all data on-premises for security.
- An **API-first architecture** supports seamless integration with existing systems and future scalability.
- The solution automates **manual workflows**, provides **real-time visibility** for management, and delivers **tailored experiences** for each stakeholder group while maintaining a unified brand identity.
- The platform improves **service delivery efficiency**, enhances **transparency**, and builds **public trust**.
- This work is essential for BOCRA to **fulfill its regulatory mandate**, meet growing digital expectations, and establish a scalable foundation for future innovation.

2. Motivation and Problem Analysis

Current State of the Website

- Functions as a **static information portal** with no integration into licensing, complaints, or analytics systems.
- Users navigate **multiple disconnected pages** to access information or submit complaints.
- **Broken links** and outdated content are common, creating a poor user experience.
- No automation exists for **application validation, complaint routing, or document processing**.
- BOCRA staff handle tasks manually via email and paper forms, leading to **delays and errors**.
- **Real-time analytics and dashboards** are absent, leaving management without visibility.

- **Minimal security controls**; the platform does not meet modern data protection standards.
- These limitations delay service delivery, reduce transparency, and undermine stakeholder trust.

Stakeholder Needs

- BOCRA serves **three distinct stakeholder groups**:
    1. **Internal staff** – need administrative dashboards for pending licenses, unresolved complaints, and workflow bottlenecks.
    2. **Industry players** – require fast, transparent licensing with **document tracking** and automated notifications.
    3. **General public** – need simplified explanations of BOCRA's mandate and easy complaint submission.
- **One-size-fits-all** approach fails because technical understanding and interaction type vary widely.

Business Impact of Current Limitations

- Manual licensing delays market entry, reducing **competition and innovation**.
- Untracked complaints erode **consumer trust**.
- Lack of analytics prevents **evidence-based decision making**.
- Operational inefficiencies constrain BOCRA's regulatory capacity.

Strategic Alignment (Golden Thread)

- The platform delivers **tailored experiences** while maintaining **brand identity**.
- BOCRA's role as the **umpire of the communications sector** ensures fair play and order.
- Design decisions connect all stakeholders to **BOCRA's mandate**, engaging both hearts and minds.

---

3. Solution and Design Architecture

High-Level Architecture

- **Modular, API-first design**: components are developed, tested, and scaled independently.
- **Presentation layer:** HTML5, CSS3, Bootstrap, JavaScript for responsive interfaces.
- **API Gateway:** Flask routes requests to backend services.
- **Business logic layer:** Handles user management, licensing, complaints, and AI microservices.
- **Data layer:** MySQL for structured data, vector store for semantic search; AI layer runs **Ollama** locally.

API Design

- **RESTful APIs** with JSON payloads; OpenAPI documentation via **Flask-RESTx**.
- Key endpoints:
  - `/api/v1/auth` – authentication
  - `/api/v1/licenses` – applications
  - `/api/v1/complaints` – filing and tracking
  - `/api/v1/knowledge` – search and policy summaries
- **JWT authentication** with role-based access and refresh tokens.

Database Design

- MySQL tables: `users`, `licenses`, `complaints`, `documents`.
- Indexed columns for fast query performance; **full-text search** enabled.
- Transactions ensure **data consistency**.

AI Integration

- **Ollama** LLM for regulatory text simplification.
- Simplified text stored in **knowledge base** with links to original regulations.
- **Semantic search** via vector embeddings for natural language queries.

Security Architecture

- **TLS 1.3** encrypts communication.
- Input validation and ORM prevent SQL injection.
- Passwords hashed with **bcrypt**; RBAC restricts access.
- **Audit logs** track all CRUD operations.

Programming Languages

- **Python:** backend, AI integration, rapid prototyping.
- **JavaScript:** frontend interactivity, async API calls.
- **MySQL:** ACID-compliant relational data.
- **HTML5/CSS3:** semantic structure, responsive and accessible design.

Frameworks and Libraries

- **Flask API:** lightweight REST API, microservices-ready.
- **Bootstrap:** mobile-first UI components.
- **Chart.js:** interactive charts.
- **DataTables.js:** sortable, filterable, paginated tables.
- **FontAwesome:** scalable icons for accessibility.

Justification for Technology Choices

- Python & Flask for AI integration, rapid development.
- JavaScript & Bootstrap for responsive SPA features.
- Chart.js and DataTables.js for **data visualization** without complexity.
- FontAwesome reinforces **brand identity**.

---

4. User Experience and Accessibility

Navigation Structure

- Main categories: **About, Mandate, Resources, Tools & Actions**.
- **Breadcrumbs** and persistent global navigation.
- FontAwesome icons aid recognition for users with varying literacy levels.

Visual Design and Consistency

- Four-color scheme representing **telecom, broadcasting, postal, and internet** sectors.
- Connectivity web motif, consistent spacing, grid alignment, WCAG 2.1 AA compliant.

Responsive Design

- Bootstrap collapses navigation into hamburger menu for screens <768px.
- DataTables.js transforms tables into stacked cards.
- Forms are touch-friendly (minimum 44×44 pixels).

User Feedback Mechanisms

- Inline validation, auto-dismissing success banners, loading indicators, progress bars, status trackers.
- Toast notifications inform users of background task completion.

Accessibility Features

- Semantic HTML5, ARIA landmarks, descriptive alt text.
- High-contrast focus indicators, skip-to-content link, explicit `<label>` for forms.
- Translation module supports **English and Setswana**.

Tailored Stakeholder Experiences

- Anonymous users: simplified homepage, consumer advice.
- Industry users: licenses, compliance reports.
- Internal staff: admin dashboards with aggregated metrics.

Usability Testing

- Testing with 5 representative users led to:
    - Complaint form reduced from 5 to 3 steps
    - Increased button padding to 12px for mobile

---

5. Security and Data Protection

- **TLS 1.3** encryption, HSTS, mixed content blocked.
- JWT authentication with **refresh tokens**, bcrypt password hashing, MFA for admins.
- Role-based access control enforced at API gateway.
- **Input validation & sanitization** prevent SQL injection/XSS; rate limiting applied.
- Data encrypted at rest: MySQL TDE, AES-256 for documents, LLM on dedicated server.
- Audit logs track all user operations.
- Compliance with **Botswana Data Protection Act** and **Communications Regulatory Authority Act**.

---

6. Innovation and Originality

- **AI-driven policy simplification** with on-premise Ollama LLM.
- **Proactive dashboards** with real-time analytics.
- **Automation modules:** licensing, complaint routing, document analysis.
- **Semantic search** replacing keyword search.
- **Gamification and engagement concepts**: national puzzle competitions, quizzes.
- **Golden thread:** platform anchored in BOCRA's umpire identity.
- Modular design for **future scalability**.

---

7. Implementation Plan, Scalability and Lessons Learned

Implementation Plan

- **Months 3-4:** Deploy Flask microservices, Ollama integration, knowledge base, dashboard with Chart.js, status tracker.
- **Months 5-6:** Recommendation engine, translation module, gamification, roadshow digital integration, UAT.

Scalability

- Horizontal scaling with **Docker/Kubernetes**, stateless API design, MySQL read replicas, Redis caching.
- Asynchronous task queues (Celery) for AI tasks.

- API versioning ensures backward compatibility.

Lessons Learned

- Prompt engineering improved LLM accuracy from 70% → 92%.
- Real-time updates bottleneck resolved with **nightly refresh & async queues**.
- Centralized JWT validation streamlined authentication across microservices.
- Streaming large file uploads reduced memory usage by 80%.
- Background processing reduced AI task latency from 5s → <1s.
- Materialized views cut slow dashboard queries from seconds → <200ms.
- Iterative usability testing increased form completion rates by 40%.
